Version 1.0 • October 2026

1. Product Vision & MVP Scope

Purpose. TutorConnect NG is a trusted Nigerian tutoring marketplace that enables students and parents to discover, assess and book qualified tutors for online or in-person learning. The MVP validates whether a safe, transparent matching and booking experience can convert tutor discovery into completed lessons.

MVP value proposition

Find the right tutor by subject, location, budget, curriculum and availability—then request a lesson through one clear, trusted workflow.

Problem to Solve

- Parents and learners struggle to verify tutor quality, compare options and coordinate availability.
- Independent tutors lack a focused channel for credible profiles, qualified leads and booking management.
- Informal arrangements often provide limited pricing transparency, accountability and review history.

Primary Users & Jobs-to-be-Done

User	Core need	MVP outcome
Student / Parent	Find a suitable, affordable and available tutor.	Search, compare, view profiles, request a session and review completed lessons.
Tutor	Build trust and obtain relevant teaching opportunities.	Create a credible profile, define subjects and availability, and manage requests.
Administrator	Maintain marketplace quality and resolve issues.	Review verification evidence, approve or suspend tutors, and monitor activity.

MVP Boundaries

Included in MVP	Deferred beyond MVP
Role-based registration and login Tutor directory, filters and profiles Tutor verification status Availability and booking requests Online / in-person lesson mode Dashboards, ratings and reviews Admin approval and moderation	Native mobile applications Automated tutor–student AI matching Integrated video classroom Subscription bundles and loyalty schemes Multi-country expansion Advanced learning analytics Automated payouts and complex refunds

Assumption: The initial launch focuses on Nigerian users, Naira pricing, common school curricula and a responsive web experience.

2. Core Experience & Requirements

Essential User Journey

The MVP must support an end-to-end path with minimal friction:

- 1 Discover:** browse featured subjects or open the tutor directory.
- 2 Filter:** narrow by subject, Nigerian state/LGA, budget, availability and curriculum.
- 3 Evaluate:** review biography, credentials, verification, ratings, pricing and time slots.
- 4 Request:** select learner level, subject, date/time, lesson mode and add notes.
- 5 Manage:** tutor accepts or declines; both parties track status from their dashboards.
- 6 Complete & review:** learner records a rating after a completed booking.

Prioritised Functional Requirements

Priority	Capability	Acceptance standard
P0	Identity & roles	Users can sign up/log in as learner, tutor or administrator; passwords are hashed and sessions use secure tokens.
P0	Tutor discovery	Filters return relevant tutor profiles; empty and error states are understandable.
P0	Tutor profile	Displays expertise, levels, rate, mode, location, credentials, rating, verification and availability.
P0	Booking workflow	A valid request stores learner, tutor, subject, slot, mode, notes, estimate and status without double-booking.
P0	Role dashboards	Learners and tutors can see and act on bookings permitted by role and status.
P0	Administration	Admin can review evidence, approve/suspend tutors and monitor bookings or disputes.
P1	Ratings & reviews	Only a completed booking can generate one review; aggregate tutor rating updates correctly.
P1	Notifications	Critical booking events produce clear in-app confirmation; email notification may follow.

Non-Functional Standards

- **Security:** role-based authorization, validated inputs, protected secrets, no exposed credentials and secure password handling.
- **Privacy:** collect only necessary personal data; restrict verification documents to authorized administrators.
- **Performance:** core pages should feel responsive on typical Nigerian mobile networks; optimise imagery and database queries.
- **Accessibility:** keyboard-operable controls, labelled forms, sufficient contrast and meaningful feedback.
- **Reliability:** prevent duplicate submissions, log failures and preserve auditable booking status changes.

3. Solution Design & Delivery Plan

Technologies & Tools Used

The MVP uses a modern TypeScript and serverless stack selected for rapid delivery, maintainability and cost-efficient scaling.

Area	Technology	Use in TutorConnect NG
Frontend	Next.js 16, React 19, TypeScript, Tailwind CSS 4	Responsive pages, reusable components, typed UI and mobile-first styling.
UX libraries	Framer Motion, lucide-react	Interface animation, transitions and accessible visual icons.
Backend & APIs	Next.js App Router and REST-style API routes	Server-side tutor search, authentication and booking GET/POST/PATCH operations.
Database	Neon Serverless PostgreSQL	Relational storage, indexes, constraints and rating-update triggers.
Security	bcrypt, JSON Web Tokens (JWT)	Password hashing and authenticated, role-aware sessions.
Delivery tools	Git/GitHub, npm, ESLint, Vercel	Version control, packages, code quality, CI-ready builds and hosting.
Development fallback	Curated mock data and in-memory auth store	Enables demonstrations when database infrastructure is unavailable.

Data & Business Rules

- A tutor account has one tutor profile and may teach multiple subjects or levels with recurring availability.
- A booking connects one learner and one tutor; statuses follow **pending** → **confirmed** → **completed**, with declined/cancelled alternatives.
- Price estimates use the tutor's rate and requested duration; production pricing must be confirmed before acceptance.
- One review is permitted per completed booking; rating averages update whenever eligible reviews change.
- Only administrators may approve verification evidence or suspend a tutor profile.

Indicative 8-Week Delivery Plan

Phase	Weeks	Primary outputs	Exit criterion
Align	1	Scope, user stories, data/privacy decisions, UX flow	Backlog and acceptance criteria approved
Build foundation	2–3	Auth, profiles, database, discovery and filters	Users can find and assess tutors
Complete journey	4–5	Booking, availability, dashboards and reviews	End-to-end booking passes testing
Trust & quality	6	Admin verification, authorization, accessibility, errors	Critical security and usability issues closed
Pilot & launch	7–8	Seed tutors, pilot, analytics, fixes and deployment	Launch checklist and go/no-go approved

Minimum Launch Readiness

- Production database, environment secrets, backups and monitoring are configured.
- Role-based route protection replaces demonstration-only open dashboard access.
- At least one priority subject and launch location have sufficient verified tutor supply.
- Terms, privacy notice, safeguarding process and support/dispute route are published.
- Core flows pass mobile, browser, security and user-acceptance testing.

4. Validation, Metrics & Launch Decision

Validation objective. Prove that TutorConnect NG can reliably attract qualified tutors and help learners progress from search to a confirmed, completed and positively rated lesson.

≥ 60%	≥ 25%	≥ 70%	≥ 4.2/5
Search-to-profile engagement	Profile-to-booking request	Tutor acceptance rate	Average completed-lesson rating

Initial pilot targets are directional and should be baselined during the first four weeks of real usage.

Measurement Framework

Area	Measures	Decision signal
Acquisition	Registrations by role; source; tutor application completion	Demand and supply can be acquired efficiently.
Activation	Searches, profile views, filter use, booking starts/completions	Users understand the proposition and workflow.
Marketplace	Requests, acceptance, time to response, completion, cancellation	Tutor supply satisfies learner intent reliably.
Trust	Verification rate, ratings, disputes, safety incidents	Quality controls create confidence without excess friction.
Retention	Repeat booking within 30/60 days; returning active users	Completed lessons generate ongoing value.

Key Risks & Mitigations

Risk	Mitigation
Low tutor quality or fraudulent credentials	Manual verification, visible status, moderation, reporting and periodic re-checks.
Insufficient supply for a search	Launch by selected subjects/locations, recruit supply first and capture unmatched demand.
Safety concerns for in-person lessons	Safeguarding policy, verified identities, clear venue guidance and incident escalation.
Off-platform leakage	Provide reliable booking records, reviews, support and future payment protection.
Connectivity or mobile usability issues	Mobile-first design, compressed media, simple forms and resilient error recovery.
Privacy/security failure	Least-privilege access, secure secrets, validation, dependency review, backups and logs.

Future Scope: One Additional Month

Week	Enhancement	Product improvement
1	Payments & notifications	Add Paystack/Flutterwave deposits, receipts, refund rules, plus email/SMS booking alerts.
2	Smarter matching	Rank tutors using subject fit, location, budget, availability, ratings and response history; save searches.
3	Communication & lessons	Add secure in-app chat, calendar reminders and Google Meet/Zoom link integration.
4	Trust, analytics & quality	Strengthen document review, reporting and safeguarding; add funnel dashboards, automated tests and performance monitoring.

Prioritisation: validate these additions with pilot evidence first. Payments and notifications should lead if booking completion is weak; smarter matching should lead if users struggle to find relevant tutors.
